

Domestic violence.

I know this guy that says the only thing we can do for women and children is to make people aware, or, spread awareness. previously, i have shown that including the father in the family, by showing them some respect or whatever it is they want to be shown be shown. then there is the fact that they could phone their fathers at work each day, to bring in emotions and such, could work out for the better. then, there is the fact that brining the community together, the neighbors could be friendly with the family, and then there would be interference if one father got violent, yes?

This is only the tip of the ice berg where people can be helped out of this situation. my best solution for these acts of violence is for the family under threat to give complete submissiveness to the male when these things happen, yes? this would see them satisfied with seeking their authority, as that is 'power' and something they seek at home - they go to work all day getting told what to do, yes?

So if the family, as they are the ones enacting the solutions, could make the father feel 'powerful,' by just doing nice little things for them, like brining them supper or asking them how their day went - if they want to talk about it - they could support the father emotionally and then they will look at the family as a supporter of theirs.

Now, it is common to have the father hit those that support them, i have observed, as the family basically cannot fight back, it is common for them to hit the ones they feel most comfortable with. if it is power you want the males to feel, have a family meeting often, where the family could listen to the father, making them feel more like the boss, and being a sense of stress relief instead of a source of stress.

When it comes to sexual assault, you could say that most of the rape cases are related to people the women know, yes? this is usually friends or boyfriends that get the wrong idea, make a move, get rejected an then rape them because they are embarrassed, of course.

The best way a woman can get over some of these cases is for them to use subliminal questioning, as women do, to find out how much the man likes her and if he wants to make a move on her, to clear it up and spare the male the moment that his mind changes from a relationship to rape that they interpret as sex, of course.

Now, if the woman wants to be safe on the street, they need to either travel in groups or take some measures, yes? if they were to only wear running shoes, they could get out of the situation easily, yes? that said, sometimes it is not that simple...

If the woman was to observe that it is a power thing, where the male usually just has a fantasy about 'getting around,' and they want to save their lives, the best thing to do is submit to the rapist, as this will spare your life, yes? i mean, underneath, it is about power and submission, yet if they were to look on the surface, it is just sex - carry a condom!

Maybe if the woman doesn't want to 'have sex' they could scare the rapist away with some 'reverse psychology?' if the man grabs her, she grabs him back, coming on stronger than the man. then she pulls his pants down, and runs! this will go from the ultimate fantasy to the ultimate escape for the rapist, of course.

I am sure there are things we could do for racism? for example, if you were to expose people to others of another race, they will grow used to them, or, get a front face ready for them. either way, it leads to better relations - they are just trying to be polite, yes?

The best way to get 'a racist' to not be a racist is with some debating. this is not a case of asking the person to stop being that way, or leave it up to them, this is a discussion where the people that want

the change can affect it, which is good.

While a person can be asked 'why they look down' on other races, hoping they go home to think to themselves - what is actually wrong with those people? - and seeing them hopefully dedicate time to this, where the only answer for most cases can only be that there is actually nothing wrong with those people, with participation, the other people can force the person to think about these things. conversely, instead of arguing about celebrities and world heroes of color, debate them about the people in their lives, as this will become personal between people and experiences that both can 'understand.'

So, you sit down with them, or make them write a test. with the test, they know what you want to hear, so will answer that the other people are good people and work hard and other rubbish, yes? if you were to have some incentive - say a competition on television - you could have self professed racists appear on television and have a competition where they need to prove something is wrong with 'those people.' this will surely, due to science, be handled in a manner where the only outcome can be that the race people agree that no, there is no problem, of course.

What is the problem? how come we can have blood donations from race to race and they save lives? there is no real genetic difference besides the sweat glands and physical form - the manner they behave in, these people of color, is similar due to needs and wants, social and financial.

If the non whites want to be accepted by other races, or even whites to be accepted, remembering that the major denominations of each country are diverse, they need to go door to door to discuss things with people, especially people that won't let them in immediately. this will put the change back in the hands of the victims or people that especially want to see changes, yes?

Or, there could be tax breaks for a company that employs people of color, due to privilege laws and so forth? this would see the diversification of the work place, where a lot of men, as men tend to speak for their families, can interact and learn to get along. only like three people of color to ten white people should do it, but, seeing as how there is only 17% hispanic in america, and 12% black, these numbers need only include one of each for every ten workers.

The justification of this could be for racism, and, failing that, could be linked to expanding the lines of privilege. then there will be, with one family of black people working high end decision making jobs, a spread for the greater family of course. i don't know how that sits with you at the moment, but let go further?

Some shopping centers or malls are centered on certain demographics - by allowing 'special terms' or writing into law that these businesses could advertise in 'demographically different media,' then there could be more integration. most racists are poor, and work with other poor minorities, forming opinions about them because they see them doing bad things, because of their role models - another thing that could use some work would be role models for all groups.

Another way to stop domestic violence, rape and racism, *period,* would be to make people empathize with others. if they were feeling the way their victims felt. this could be done with regular television channels and major radio channels broadcasting stories of loss and weakness, of course. if you get the aggressors to think about how it would feel to do things like this to other people, then they would surely be less likely to do them. the way to do that is to put them in the victims shoes, yes?

This could be done by songs, but people don't really listen to songs. so, on the radio, there could be mock broadcasts - or real ones - of victimization of these people, en mass. this will get everybody talking about it, and, no doubt thinking about it for their arguments. eventually they will get to the point where they think of what the real issues are, getting in the psychological aspects of it, and, at least on a surface level, empathize with others.

Then, there could be a television program where men rape women. this will show them, yeah, it is

great to have sex, yes? wrong! they will see how the women are bruised and how they did not like it, dousing their fantasies. there is a problem though with the fantasies maybe manifesting in young and middle aged men, even old ones, but, the damage done to the rapists could make them think twice - the paranoia they will go through, and, the 'being caught.'

For racism, there could be a documentary into the wars of yesteryear that focused on ethnic cleansing or such - i doubt americans and westerners would agree with that? the we could show the klu klux clan - i doubt the racists in the third world would agree with that?

All in all, empathy and dismissal of involving oneself in these acts is essential.

Another issue of this making the aggressor 'feel things,' is 'love' and 'social norms.' in the former, they need to love others as if they were themselves, and in the latter they would want to feel part of something bigger than just them, yes?

So, to make people love the people they are going to harm in some way, they should all get hobbies. hobbies are either social things, or, they are things you do to show others, hopefully? taking an interest in life is important, as that leaves less time for day dreaming, saying yes to certain things that were taboo before the day dream started, and then actually plotting these actions.

~ Something to be said about depression too, if the person is feeling depressed, taking an interest in life would really be made easier if you started with 'physical things.' if some teenager is moping around saying that life could not be any worse, ask them to skip a meal or lie next to their bed when they want to sleep. i think they will agree with anything you take away from them that life could be worse, of course.

If you want to use society to get the required emotions out of someone, then you need only talk about it and have it repeat some how. i remember when we were in the nineties, everybody was crazy about japan and the yen and stuff. now they all crazy about china, yes? the things to concentrate on are 'strengths' as that is the only logical love. if you see strength in something, you are likely to love it, be it an eagle spreading it's wings or a gun, okay? when you feel small, you tend to reach for the strongest thing you can find, of course, being a childish social hard wired need. maybe we could have many military and police 'parades' - this would make 'law breakers' in awe of the numbers of police and army, and, they would likely come to love their strength and demeanor. hell, they should love their presence, as, they are keeping law and order.

War in africa.

The various wars in africa mean that there are many lives being lost, resources polluted and abused and money being stopped from generating itself. the whole world should be involved in these wars - what if the world were to come together and declare war on boko harem, i.s.i.s. and company? This will make the likes of militants fear for troops arriving, yes? with that in mind, why not arm the populace that are able to fight? the rebels managed to do it, the people cannot work as long as they are at war, so, they should all be involved in the war in some way, of course. maybe even something simple like a few phone calls to the cities where i.s.i.s. is infesting - they could reassure the people, or, organize an underground of brave young men to thwart the actions of i.s.i.s.?

Being more crafty would mean they could use telephone lines with morse code to deliver messages? this could be done by having the message sent some how to them, maybe with an aid worker? a quick discussion would mean that it would be on line for all of them, yes? i am not sure the exact way they could help, but i know they can help. maybe they could send them some components for simple food poisoning?

Then, the state could also fly private helicopters over the are, taking photos of where the road blocks and forts are? this would serve as a good way to 'google maps' your way to a direct hit on them while they are resting, yes? simply getting the people inside to tell you coordinates, or, street names and numbers, could really help.

In the Congo, there is still war raging, but it is not that big numbers wise. But, they need help, and, this will settle the markets of the area, knowing that militias will not come through and steal food and rape women whenever the mood takes them, of course.

So, I am suggesting, seeing as how the houses they have are easy to make, they abandon the rivers they cling to for food and nutrition, and leave the area. It is very hard for the army to fight and track people there in 'the jungle' and that makes it ideal for the militants. If the support of the militias were to come together and leave together, putting their differences aside for the sake of survival, the militias would be left stranded, yes? This makes it cheaper than running a war for another year or so, of course.

An alternative would be for lasting peace - the people that support the militias need to come together, and bury the hatchet, for the sake of, again, survival. If they were to meet up, there would be no spreading of leprosy or anything, yes? The thing is, the militias rely on the stereotyping and racism of the people that support them to prove their place - "what would they do without them to protect them?" I mean, if the soldiers were not there, what would change... would the screaming hordes of war painted savages run amok? Of course not, but, due to propaganda and blaming the other tribes for food shortages, they seem to have a place, these militias, of course.

So, move them out into the open or make peace between the tribes, that only keep hating each other because of the soldiers own gossip. In fact I bet this whole thing started by some soldiers wanting some applause from the people, yes?

Ethnic cleansing is sort of like genocide I find, and there is no place for this in any sovereign nation. That means we need to persuade the soldiers not to kill 'other types of people' just because they are different somehow.

The first thing that comes to mind is that as servants of a god, surely they must try to make them pray to their god first before they kill them. This is a gift for their god, the prayers of another as they are filled with the love of their way of life. They should instead go into these areas, with their guns if they feel unsafe, and socialize with these people. This will make it hard for them to kill someone they know - why have enemies when you can have friends and show other salvation?

If we are to have paradise, it should not have a lot of corpses lying around, yes? Are these bad people? Must they die? They have been shown their ways by their forefathers and will not be won over easily.

Now, think of this - say they have guns and want to kill the 'crusaders?' This would mean they would die for their god too, so, turn that around! The people they kill are dying for their god, truly blessed, maybe on their way to hell, yes? This means you need to take them as your children, and 'rehabilitate them,' of course. I know how hard it is to speak to people sometimes that have a different view, but, honestly, does your god want more prayers or to see people dead because you love him?

Boko Haram is still at large and recruiting people quickly. There are cases of torture and stuff too from this major African militant group. They seem to hide in uniform, as this is a cult code I would suppose, as they believe that hiding the cause is bad for them.

So, what can we do to stop them? They say they want something noble, yet they do not act nobly to get it. They say they will help the people that help them, yet this is a one way street at the moment.

Why not put a bounty on their heads? They know who the 'commanders' are, and they could offer much money that will be saved from fighting the war. Maybe if they had it explained to them that they will starve if they have their way, to continue fighting, they would realize that they are fighting a losing war, impoverishing the whole region they are fighting in or for.

Due to the recruitment of the faction, they will never be without people to fight for them. maybe they could buy a cease fire? all they need is to taste the life of not hiding and fighting for a week and i doubt they will go back to it. they are obviously mingling and stashing their weapons in the cities and farm lands and need to unearth this stash to take the teeth out of their fight.

This might require some help from the ayattollah and the saudi royal family - if they can be seen together, the ethnic cleansing will stop and they would likely receive much as yet undeclared things from the people around them. then the commanders would likely say they have lost their way, and continue fighting, but as for the ethnic cleansing, the super delegates could help a lot.

They should ask the community to look out for people that always seem to have money or have a prosperous lifestyle in the city yet do not have jobs, they are no doubt filters for the militants and would be doing something illegal, yes? if the local police were to make this situation known, then there might be a lead, especially if there is a cash reward.

~ Then i heard about there needing to be halved food rations in kenya for refugees? this could be overcome by giving the refugees all the vitamins they need by getting them a few herbs and such, to make sure they stay healthy, of course. maybe they could also dig for clay to eat, yes? this biomass comes from water mixing with sand and then also some plants, making it edible.

Then they could use satellite imaging, if they can find a sponsor for a few days, to find all the metallic stashes of weapons - i think it will be blue under imaging? - and then also all gunpowder stashes - i am not sure of this color.

There must be a way to end this terrible war - it has been raging for many years and seems to just carry on. being on a port, it is easy to see drugs make their way to the militants, and, then to the army base for guns. this is why i am suggesting a drug test for all army personnel to find out if they are taking these things for guns and supplies. that should bring in some dividends?

Then, they could also eat away at the morale of the militants by showing how much longer 'the war' could go on for. this would be where they show them they are not fighting for freedom, but, rather for resources, yes? this is a case where the fighting is leading to less resources, as the fighting will decrease the countries ability to 'produce,' yes? if they really want to fight for resources, then they need to bring food and water to their people themselves - the others are too weak and afraid, but, then, there will be fighting amongst themselves for resources - even the guy standing next to you needs these things.

I have come up with a way to make water and grow giant fruit, and, this will not be realized as long as there is fighting - the war should end as there is now enough, but only as soon as the fighting stops. fighting over land is not the issue - with sewerage they can cultivate any land with 'biomass.'

~ Biomass is living things. anything that you eat gets processed and pooped out, and, then keeps some of the living things from your body, be they poison or not, they land on the ground giving it nutrients and 'biomass.' this is like plants, food, dead bodies... they all lead to a healthier farm land.

Now, the leaders of al shabaab will be saying no to them returning, as, the fighting is the only way for them to get power, which is what they really want. they have forgotten the trappings of life, and instead have empty dreams of power and money. getting rid of the commanders, and making sure no new ones come in, will go a long way to ensuring the livelihood of many of the people of somalia.

There are plenty of people out there ready to put on a mask of 'religious crusade,' yet lust for other things - we are all human, i am sure those of you out there will understand. you should observe a leader of a militant group that acquires a city - do they change and become greedy? do they put themselves first? these are not holy men, are they?

Anyways, there is a way to satisfy the laws of sharia, the most costly one for the state being that there should be no interest from banks. this could mean that the money will grow for the bank itself,

and, encourage investment, yes? then, there could be other banks near the borders for citizens to put their money into, or have these offices at embassies, which is land belonging to another country, yes?

As for womanly affairs, i find that this is happening in suadi arabia and there are no problems. the women there are not outraged and do not shout at the western cameras whenever they can with masks on to demonstrate - women long for security, not freedom. if it is freedom they seek, then they have no security as they seek security by 'psychological main stay standards.'

~ Isn't it funny women in saudi are quite while women in america protest for freedom?

I think these goals can be realized quite easily, with thieves having their faces marked with tattoos instead of having their hands chopped off, yes?

Otherwise it is only 'the devil in the details.' if a serious scholar was to try to balance the forms of sharia with the way things are, yes things will change and there will be no more recruitment of people under the guise of religion while the leaders get so corrupted. i am not sure how all this started, but i am fully aware of what it has become.

Refugees.

With refugees, you have human capital, they are not necessarily a liability until they are idle. this is because they will have the same needs whether they are working or not, yes? of course if they were doing something constructive with their time, things would be much better for everyone.

So, how do you turn someone with skills of some sort into an asset... let me think... you supply them with a job? no, that would be too easy, it is easy to build a factory and a few houses every few kilometers and provide an environment where they can live and work, generating a profit for the owners. this is if they were to look to where the market is lacking, instead of looking to maximize profits. this would be like living in switzerland and either making chocolate or toothpaste, yes?

Or, the state they live in may decide to donate tools to them? hell, the prior country could pay by buying tools out of their accounts, those missing for too long from the roll calls, and then they would be able to buy the goods they need, yes?

Or, the refugees could work right now! they could double up as a night shift at many companies, doubling outputs for more gains? this would mean, for example, a bank could now operate twenty four hours a day, allowing the stock market traders to operate at these hours - something that europe would likely think highly of, imagine getting in there on the asian markets before anybody else? or, they could bake twice as much bread for twice as many customers, as the other refugee night shifters would need food that they could buy with their pay, yes? having twenty four hour cities would be great for tourism too, but it is winter now and would not be as apparent right at this moment. things like call centers could benefit from more people with languages too - there are too many ventures that could do with twenty four hour staff, even making better working conditions or hours for established native staff, yes?

Now i must shift to something related to refugees, tribesmen in poverty, especially in my country south africa, where i realized this point. these people would be obvious candidates for welfare or such, but maybe we can empower them to be their own 'financial masters?'

So, we have human capital and land, some livestock and such. if they want to make their own way, they should start breeding their livestock - maybe they could loan some money, with the surety of their own assets, where they will sell some of their horses or something for cash? this requires much 'sows' and 'fillies' that they can bring in, maybe middle or adequate stock, and then they can breed them with rest of the money going to food for them?

Or they could loan tools? this they could use to make products or such, maybe for subsistence

farming, where they will also secure running water and irrigation - if they have requests, they can take them to the bank, dressed in their traditional dress and royal garbs, which could be respected and accepted as evidence of their positions, and then hammer out a plan with them?

Refugees in Africa is a real problem, as, they have fled for their lives. if they were to return home one day, their houses would be looted and in ruins, without identity documents it would take a long time to secure their residences again, but there will be room for everyone - that is if they return home. it is much easier to flee and put it all into that march than to return home, so, we need a plan 'to stay' too.

On the plus side, this means human capital for the regions they are in at the moment. of course, there is the problem of funding these multitudes, but, luckily i have a plan. if there is a need for food, first, to get their strength up, the companies around them are that plan on expansions could front them food until they can deduct it from their salaries. this will be made possible by fingerprinting the people that are there, using the various under utilized public service sector employees to help out. this will be 'to be counted.'

Once they are counted, they should be given places to live. this is easily afforded to them by using cement and bricks to build their own houses, their strength returned now after the food they have eaten. the people that usually build, the builders, would oversee the task, and, then advise them on how to build. this would mean they would take like two days to build their houses, of course. cheap cement and bricks, the state owns the houses, they live there for now.

~ If you were to count these houses as assets for the country, as they cannot leave the country, the value of the monetary system will improve, yes? plenty of reasons to sponsor some building materials and cement mixers. i am sure any city has enough of this to cover many people.

So, they have been counted and now have residences. time to get them generating income, yes? this would be possible by using old tools, where there are deductions on new tools and machines, and the old ones could go to the refugees. then, the refugees could work and generate an income. but, careful planning needs to be observed, where the state plans how to expand the economy - it is no good to have everybody making cars or computers - there will be no economy, as, there will only be these things to trade, yes?

Then, they could offer 'start up' loans. it is a known that eighty percent of start ups manage to make it, and, with demand this high, there is almost a guarantee that all will prosper. this would mean that for five thousand dollars to a start up, it could come to, for a million people, five billion dollars, or, more understood domestically, fifty billion rand per start up. this will require a lot of imports at first, so the state will make some taxation back on that. then, there will be much trading with their start up cash, trying to make more cash from the other refugees, having it circulate and obviously attracting business from the established cities.

The major deficit for this will be for public services, in the form of services requiring 'capital layouts.' these would be municipalities, police, hospitals and so forth. i estimate the actual buildings would cost typical amounts, meaning that this, the major draw back, will be setting the country up for major economic taxation and gross development economically.

~ less in, more out. surety with investors - the people are not going anywhere, are they?

Medicine.

I was chatting to a friend of mine, and they bet me, as they do not believe in me, that i would get a headache if i could not cure tuberculosis as well as i have wasted his time reading about my other cures - he said he would laugh at my headache and then we could watch some sport or something. i was offended at this, so here i am, plying my pseudo science masterpieces again!

So, onto the issue at hand, t.b. if we were to understand that t.b. is an inflammation of the lungs, where the bacteria, which is little living 'things' that feed off the life of other things - yes diseases are parasites, as is every living thing - then we will see that they need to eat what we eat to live, just that we process these things for them, and then they do not need to evolve teeth or mouths, not throats nor stomachs to process them and draw 'fuel' from them. this is because they are either very young life forms, very successful life forms, or lazy parasites, yes?

If we were to observe that the ways of the parasites is to consume everything non selectively, as even aid just spreads from cell to cell, as they do not really have eyes nor senses - they just shrivel and die like wood when they are attacked - then we will see that they just simply eat everything they touch. this is my new theory, i am sure it is new, and it is supported by the fact that they travel, the t.b. bacteria, from fuel source to potential food source. this is done through cellular reactions, where they simply - lacking senses? - react with the world around them and then 'seek fuels.'

Now, to cure t.b. which is a bacteria, they like to sit in the lungs where the fuels are. this means their fuels are typically mucous when comfortable, potentially, and gases generated by the body during respiration, of course. this means that they will use sugar apple steam - yes we will boil the sugar apple in a pot - and inhale the fumes for a great relief. continuing to do this with the pot of goop will mean better reactions, of course.

~ Remember, the apple seeds are the most lethal poison known to man - cyanide.

High blood pressure is a very common condition where the blood vessels seem to be under strain from the heart pushing the blood through the vessels. this is where there needs to be either less force from the heart pushing the volume of blood through the veins or there needs to be less blood going through the veins.

An easy remedy would be to eat and drink less, as, this will stop the generation of blood for your vessels.

If you were to suffer from this condition, it might be because your muscles are too stressed and put up resistance, think of how your shoulders tense up due to 'stress?' a good way to deal with this would be to get some exercise, as, then you will relax your muscles - just a minor amount will do the trick.

Or, you could take a 'laxative.' deep heat or the muscle relaxing sports creams could also be used.

Asthma is where your chest gets tight and you cough, so, it would serve you well to get the muscles to 'relax.' obviously inhaling deep heat would heat and relax the lungs to a degree, but we want a cure, yes?

Maybe if we were to go to gym and crack open our chests or something - i have heard of this happening - then there would be more space for breathing through the lungs? if we were to observe that adrenaline causes muscles to relax too - as you start to shake when it is used, then we could ingest some medicine of this sort to relax the patients lungs too?

Or, we could try to wear a 'wrist watch' that gently soothes the muscles somehow? stress builds up from below, starting in the feet, as muscles start to contract, so, if you exercise, you will find that after a while the energy that is collected will go up to the lungs from the feet... maybe wearing a special type shoe, like a flip flop or a sneaker designed to massage the feet while doing things, or, living, will help?

Of course, if that is not good enough, then we would need to, like with c.p.r, only lightly hitting the chest, clear the pathways. hitting someone on the back is supposed to help, and that is close to the lungs, but i prefer hitting someone on the chest, of course.

Or, it could be the nerves of the lungs? these nerves could be 'dry,' leading to coughing and the rest. if we were to observe that with the flu too, there is coughing and phlegm then we would suppose that this sort of coughing, the flu, is about too much mucous. if we get enough mucous into the lungs, but not too much, it should clear it up with coating the lungs with a lubricant of sorts.

Of course, the reason the asthma sufferer is suffering is because they are forcing their lungs to breathe too much. if they were to, as i learned to speak without a lisp once, 'learn to breathe' without forcing the lungs, then there could be a cure! if the breathing was more regulated, maybe with a breathing exercise three times a day, in which they breathe in deep and slow and out the same, then they could avoid side effects.

But, back to the shoes. if the shoes were, and they will be a little more expensive, deeply cushioned, the feet would relax, causing everything north of them to relax too.

Maths.

Division is where you take something and cut it up into segments of the value it is. with a logarithm, you take the smaller bigger value and divide it into the smaller one, or, you raise the base of the smaller one until it equals the major value. with my form of maths i like to use the bigger one divided into the smaller one to show how many times it goes, or, divide the larger value into the log itself.

But, that is easy. if you want a general rule of thumb for dividing things you don't have values for, like $[2a^3 / 5b]$, you need to find common ground, once more. this would be where you take the $[16a / 5b]$ so far. not knowing the values of the symbols, you need to take the values you do know, like $[16 / 5]$, yes? this would equal 3.2, of course, as the remaining one from sixteen would equal one fifth, or, twenty percent of the total.

Now, did that help? i think it did. if you were to now take your $[3.2 * ab]$, this is about how far you could go.

 Originally Posted by https://en.wikipedia.org/wiki/Complex_conjugate_root_theorem

In mathematics, the complex conjugate root theorem states that if P is a polynomial in one variable with real coefficients, and $a + bi$ is a root of P with a and b real numbers, then its complex conjugate $a - bi$ is also a root of P .^[1]

It follows from this (and the fundamental theorem of algebra), that if the degree of a real polynomial is odd, it must have at least one real root.^[2] That fact can also be proven by using the intermediate value theorem.

So, there are a lot of computations that stem from this, but, we can figure it out just from this equation if we figure out how. This equation follows up until a prime number, as it has dot dot dot with a prime number in the end, so, the first prime number, being two, is where the equation ends. even though the equation has a 'to the power of two,' this is the final step, of course.

This follows that $p(z) = [6a 5z + 4a 4z] = [10a 9z]$

I have gotten bored of the one dimensional formulas of high school maths, and, wish to impress you further, so, i am moving onto college maths, fluid mechanics of navier stokes to be specific.

So, we have an ultra hard equation? this will be simplified by observing in english language how to do it, yes?

This would mean we take the velocity of the fluid - how fast it is going adds to how much force is in there - and the density of the pipe or such. this would mean that we take density of the pipe minus the velocity or pressure on it, of course.

To calculate the pressure, you take the volume plus velocity, yes? so;

[Density mass of pipe / Volume + velocity] = capacity.

Then, there is differential equations. these are about physical values, changes in them and others and the relationship between them. so if we were to look at this;

We could see it sounds hard, yes? look at all that junk!

So, we need to simplify it. the best way to do that is to work with the value on the left, as, it is equal to the equation on the right, yes? this means we need only work out $[A_u / A_t]$, yes? without these values, we need to find the real values and work it out, which would be $[a / a = 1]$ meaning everything is equal to one, so, it is one divided by one, equaling one, one $[u * one] / [t * one] = [u / t]$.

Wasps, bees, hornets and others.

Yes you all have these in your gardens, but, it is winter for most of you out there, and, it is summer for me! this means i will be enjoying more of this than you, of course. these things are fun to play with, you bet your ass!

It is getting less and less clear how to attract what, but, if they are there, they would be in tune with your energies or heat you give off. this heat is similar to an aura, and you can alter it by breathing and speaking, which will send out sound waves to the flying creatures. this will be sending a tone to them, as if it were a form of energy itself, and, tones spoken honestly like "i love you" will let them know, unless they are false, as it is the pitch of the wave they understand. this is reflecting the sounds they make with their wings while they buzz in the nest, so, they will understand the core of your message to them.

Of course, if you want to pick one up, you need to 'persuade' them to let you do so. thinking of helping them while you speak, while you say anything, will be reflected in your speech. thinking of yourself as one of them might have a weird effect, as all they do is collect pollen and mate, yes? so, if you were to appear as a 'beautiful egg' to them, you could attract them to sit on you.

~ Recently i had a hornet crossed with a wasp sit on the tip of my finger for more than ten seconds, of course.

Fund raising for the state.

All countries have money through taxation, something they can rely on. this is basically the only way they make money, and the temptation to raise taxes remains strong. if they were to look for alternative methods to generate funds, they would be much better off, and that is what this is about. i hear some of you with very simple methods to generate funds, things that require all the capital and generate something meager like fifteen percent over a year, of course. i am here to show you a new way to generate funds easily and quickly, in vast sums, of course.

So, what is my bright idea this time? if we were to observe that the state has money, more than a

billion in hand from country to country, at least, there is a lot you can do with a billion. this billion can generate much funding - i am working with a billion, not two hundred times as much, so far.

[1] If the state wants to see the money grow, they could observe that scarcity equals more value. if they were to buy their money back off the market, they would have lost nothing, as they still have the cash in hand. then the currency will grow in strength, and, there will be a cash shortage for the country. this will mean the private sector will find it hard to operate due to lack of money for all customers, and they will need to borrow from the bank to get more for themselves too. some businesses will fold and these will be sold to other bigger private sector entities and then the market will be stimulated with more money. let's make this more structured?

Money, is bought with money. this means it travels from the hands of the people into the hands of the state. this means less money is available, and, the banks need to borrow from the state to let the private sector borrow from them, of course. seeing as how banks do so well each year, this is no problem to them, and the link is there.

[2] If the state was to run 'a state insurance' regarding marriage, then they could make sure both parties are looked after in these cases. this would be where each month the couple is married they need to pay a insurance fee. of course, most people remain married, so do not need this insurance, and, it will help fund the court matters that the women cannot afford often.

Opposed cultures.

I would now like to put into a title a view of mine - "the naivety of the west versus the reality of the third world." this is about the way people live in the cities of the first world and the views they take - they think everybody must live like them, as it is the right way to live, as they are right. on the other hand, in the third world they live like their forefathers, more religiously, with more interactions and more understanding, listening in fact for a logical way out of their ordeals while at the same time looking for resources for themselves. often there is a clash of morality and needs, in the third world, as there are ways to secure resources immorally, and, if your stomach is empty, you seek to fill it any way you can, of course.

So, how easy is it for a college student in america to say something must happen, then hope the authorities make it happen? sometimes they will protest and try to force a change, and this is obviously good, to be involved marching for the rights of another. this is empathy. if they were to tell their leaders to make changes, that is also easier said than done, as, there are resources to be shared out to affect these remedies.

Then, they say that those people are backwards. this is trying to change their culture, and, as i have said before, there is no porn in the third world to speak of, none of the really sick stuff you find in the west, and there is more empathy in the third world, as the people find strength in each other instead of secluding themselves in their fantasies about 'power and wealth.'

Something they have in common is 'love of sports.' this is a global love and obsession, which brings people together. this shows that people will, having everything sorted for their own culture or region, revert to the same wants and needs, yes? how about nice food - everybody loves eating cake, yes? this brings men and women together, as women globally live their lives around men, as, this is like a status thing for women, who is an alpha male worth talking about, and who is with them.

This means that there needs to be some new, slow, legislation in the third world, helped along by the first world. they must understand what they are protesting or talking about, and this calls for some observation - why do they do these things - not just calling something that looks like a duck a duck, it is not that simple.

Linguistics.

let us observe the hardest alphabet to learn, one we all use that is reading this, english. how did the letters bring about the 'phonetic syllables for sounds?' if we were to observe a snake goes "s" it would follow that the figure looking like the s of the alphabet is s for snake, which makes a "s" sound.

So, starting from the beginning;

- [01] A. if we were to observe where this sound comes from we would find it comes from, the most basic of words with sounds, "ah" for "pain" or "realization."
- [02] B. brrr, bee, breathe. cold wind. bah, baby goats give us milk - close relationship.
- [03] C. cold, cough, caught. slowing down or interference, impeded due to something.
- [04] D. dear, dive, deep. depth or large amounts of something.
- [05] E. empty, enough, energy, evidence. description of "values." amounts we can measure. stop or start.
- [06] F. full, found, fund, funny. opposite of "e."
- [07] G. go, got, grind, gouge. Something leaving or incoming.
- [08] H. halt, hop, haunt, hollow. deprived entrance or exodus. opposite of "g."
- [09] I. in, inner, inside, it, inhale. "movement."
- [11] J. joke, jade, jaunty, jovial. "happiness." pleasant emotions.
- [12] K. kill, kiss, kite. "victory."
- [13] L. lose, last, linger, long. something "concluding."

- 13]M. men, main, mire, mouse. something of emotion, related to other letters.
- [14]N. no, not, none, nun. refusal, conclusion, contest. "resisting."
- [15]O. other, on, one, owe, or. "transfer."
- [16]P. poor, pond, pick, pony. "taking less."
- [17]Q. quill, queen, queer, queue. "very interesting, worth waiting for."
- [18]R. rule, run, rung, rune, roll. "movement of authority or self."
- [19]S. sew, soon, song, sun. "rejoicing."
- [20]T. tear, ton, trick, tongue. "bad thing happening to valued thing."
- [21]U. under, utilize, unto, use. "giving something."
- [22]V. vault, vex, vivid, volume. "storing something."
- [23]W. walk, wise, want, wink. "strength."
- [24]X. * exit, excite, exhale, fox. "quick, speedy"
- [25]Y. yule, young, yes, yeast. "rebirth."
- [26]Z. zest, zeal, zero. energy coming from some where else - "filled."

Statistics.

This is quite exciting, as, it mixes maths with economics and philosophy, things i find a liking for, of course. basically, it is about unknown factors coming together for a scientific analysis or study and explanation.

So, let's get started with the first on on the wikipedia list; "how to detect and correct for systematic errors?"

If we were to want to detect errors, we first need to define "an error." an error might be where the facts are false, or the figures are false. to check facts, in something as broad as english, we need to observe some things are obvious and make sense, and others do not. if i was to tell you that investing a million into a blue chip stock would only bring you seven percent yields over a year, and instead investing five hundred thousand in smaller businesses would bring you more, you would laugh, yes? let me explain...

Buying 1,000,000 worth of microsoft would get you say 50,000 shares at 200 a share. selling them would bring in more or less the same as you bought them for, so, as it is better to invest in

companies this big rather than simply banking it, it would yield 7% profit for you over a year or so, coming to 70,000 yes? if you were to invest 500,000 into a company that sells its shares for 20, you would get 25,000 shares. the rate of growth for the smaller business is about 10%, so, you will have gained 500,000 in profits. as we can see now, it matters more how many slices of cake you have than the icing, yes?

So, it was an error to invest in microsoft, yes? this error is reflected by 'comparisons.' to detect an error, it is good to do some book keeping, to check the facts of all investments, and, find the best one, considering in out ratio or gross capital, depending which is more. this is relevant for investing and banking, of course, errors. this is economics mixed with math and philosophy if you were to ask me, holding true to my own definition, of course.

Now, detecting errors would become easier with 'research.' then, there is comparing known effects, and comparing old data. an error is where you have taken more and given less, so, giving more to the pessimism and less to the optimism is correct. if you were to round up for your income and down for your expenses, that is an error. this way, making errors will have no effect other than present surprises.

Meta-analysis: Though independent p-values can be combined using Fisher's method, techniques are still being developed to handle the case of dependent p-values.

The p-value is defined as the probability of obtaining a result equal to or "more extreme" than what was actually observed, when the null hypothesis is true.[5][6]

This is where we need to find that the p value gives a better estimate for us than the null hypothesis. this means the value would be exaggerated and lead to faulty planning for whatever field it is used in, of course. if we were to run multiple observed values into one, then take averages from them, and compare that to the p-value, we could find 'a better estimate.'

Maybe if we were to add enough values together, then divide by the amount of values, we would find a good estimate, but, can we find an exact estimate? this would just be an estimate though, so we need something concrete!

By measuring air temperature and humidity for things like biology, we will find our 'exact outcome' with enough factors being pressed in. in the case of biology, for example, the other determining factors would be lineage more importantly, as then there would be something of a d.n.a. map. this map is more accurate than other factors, as, this is the blue print for what the mature thing will resemble, of course.

Back to economics and other uses for p-values. have you ever noticed how those boards at the stock exchange always nearly stay the same, with the majority of everything staying so much the same they need to take it to fractions of percentages? this means there is little change with the stock exchange, unless new d.n.a. or investment comes in, and, if 'recessive genes' leave, yes?

Calculating this can be down to finding out how many policies are maturing, as, it is only with that information that you will find new money being freed up, or, how much the diet is changing of the creature or cell.

Behrens-Fisher problem: Yuri Linnik showed in 1966 that there is no uniformly most powerful test for the difference of two means when the variances are unknown and possibly unequal. That is, there is no exact test (meaning that, if the means are in fact equal, one that rejects the null hypothesis with probability exactly α) that is also the most powerful for all values of the variances (which are thus nuisance parameters). Though there are many approximate solutions (such as Welch's t-test), the problem continues to attract attention[4] as one of the classic problems in statistics.

So, we need to find the most powerful test, or die trying! yes!

If we were to test via 'heat exchanges,' that would be where we measure the heat generated by all

living creatures on a hill, we could discard all 'masses' that are 'too small' to be 'sheep.' this will leave us with subtracting all identifiable 'heat compositions' that we identify as not being sheep, or, we could measure the heat of the wool on the hill by using thermal imaging to see the wool on their backs. this would let us measure it in weight as if it were 'biomass giving off less heat than the actual sheep' and we could 'count it' perfectly, up to the second of taking the 'thermal image,' yes?

Now, in a marketplace, we could detect how many people are hungry on their way in, and adjust prices like the markets do, yes? this could be done by listening for their stomachs groaning, or, measuring how much the cells have in them compared to cells in the stomach and in the blood stream, finding the difference would show how hungry they are, more or less.

If we were to take this to the boardroom, we could count the number of people in the city and get the average income. to find how much business you will do, merely phoning everyone and asking them to place a deposit will result in you making those gains that day, week or month. this can come with a secure deal, over the phone, simply and easily. to get enough people to phone around like that, you merely need a s.m.s. program to count the 'pledges.'

Multiple comparisons are where there are a large amount of stats to compare. if you were to ignore some, how do you know they won't all lead to the same answer while the ninety percent of them swing the other way? this is hard to tell...

So, if you were to observe that seasons can change markets 'purchasing,' then you will find that everything should be compared due to different dates, as this will show the real comparisons.

Let's say you are selling 'tampons?' this would mean you would sell a set amount each month, with more coming in each month that a girl 'reaches maturity.' so, if you were to take the ratio women die at, compared the the influx of women, and add that to the stats for 'sales' so far, you would find it easier to predict, nearly exactly, the amount of 'tampons' to produce.

~ The only problem is that there might be a 'woman' buying for two months. even if women 'share packets,' they will still have to buy another one to 'adjust' for the 'double consumption.'

Post war rebuilding.

I have no idea when the wars will end, but they will, yes? if they end, they need to satisfy the people quickly, or, some people will steal to get enough to buy guns to take all the resources, citing the new leaders as a failure, yes? so, how do you fix an economy quickly?

If you were to observe there are a few things they need and some they do not have, they should focus on what they have at the moment to satisfy these needs as best they can for now. it is typical for a fireman to save the people that are easiest to save first, as this maximizes lives saved, yes? you simply do not go to the back of the room to save those that are nearest death, but you want to save them too, not knowing how much time you have. now i am not talking about life and death, as all these people will live, i am talking about helping people and capitalizing on gains as much as you can. this means you do not make plans to build first, nor pay government staff, first you use what you got to do what you can, of course.

If you were to observe the things they will have, they will have towns and cities that are in good shape. the people need places to live, but they may live in tents for now. where to focus attention is up to the existing buildings and temporary market places - there will be merchants with food and water, of course. the problem is wealth is in their hands, while the customers do not have enough wealth to buy their goods, which leaves a surplus in the market, which is not what you want from the only resource you have, yes?

So, you need to empower the people to generate their own wealth, as a welfare state is a nightmare nobody wants to be in charge of. what do they have - human capital, buildings, machinery - let's

move with the machinery. the factories are often found outside the city center, so will be undamaged. they need to phone or contact the factory owners to tell them to come back, as they still own the assets of the factories. this will generate an income, but, we only have food and products now, we need to generate sales too.

To generate sales, the shops need to be rebuilt, as these are where most monies changes hands. this means the priority of the state so far is to 'renovate the shops.' call the owners or seize the assets under 'temporary nationalism' for now. this will make for a better market place.

Then, another thing they need is health care. there are no medicines left in the shops, as they were probably looted. this means that they need to produce them or import them, with capital - if you buy a medicine for 10 you can sell it for 13 or so, at least, so this should attract the leaders to this, yes?

So, health care, jobs and so forth are all sorted in like a few days. in the mean time, the state should buy food for the people so they can work, running up a tab from their personal bank accounts. sharing the wealth would be optimum, suffering from buying food is nearly unheard of for the individual and then shared out will feed everybody for a few days until they are back on their feet. they still have banks with money in their accounts, at least for foreign banks.

Neuroscience.

"Consciousness: What is the neural basis of subjective experience, cognition, wakefulness, alertness, arousal, and attention? Is there a "hard problem of consciousness"? If so, how is it solved? What, if any, is the function of consciousness?[1][2]" ~ wiki

So, we need to find the root or reason why we feel these things? for a start, it is because we have been exposed to such sensitive things in our habitat, and, move around very little, as we are not developing to migrate like birds do - this would be where they develop to migrate rather than develop to feed off one habitat. we build houses and buildings as ants build colonies, and, we are settled.

~ in fact, we are getting so bad with putting down roots we now have to have documents to do even simple things like getting a library card. this means that we are settling more and more into one habitat.

So, because we need our habitat so much, we must find a way to see which habitats are ours and so forth. cells can only develop in one direction at a time, i guess, and this is because they will develop as we 'push them.'

If we were to observe that we feel far more sensitively than other life forms on our planet, this is because we have become so attentive or 'focused on details.' this is because we have developed tools from rocks and then we would judge each rock, looking for the best one - analysis. bartering is an advanced concept that only we have, as this relies on society that is settled, once more, as then there is insurance of getting it back.

A while ago i thought that the reason we were so advanced was because we are paranoid. we have no natural weapons, we have no inherent resistance to diseases, we become paranoid as we are helpless. while we may have been able to eat food right off the tree, we would have been competing with elephants and buffaloes, which have 'natural weapons.' lacking these, we had to find ways to compete within our own means. this led to having to figure something out or die, of course. as we forced ourselves to solve these problems, we evolved into 'problem solving creatures.' then we built tools and farms and so forth.

Then, we managed to develop a language, having very expressive bodies - that is our genetic strength, our expressive bodies. think about it, lions don't need to communicate much, do they? this brought us closer together and then we developed into social animals.

So, from this we can see that we needed all these things to become what we are now, and, due to our 'greed,' we will continue to develop like this.

"Perception: How does the brain transfer sensory information into coherent, private percepts? What are the rules by which perception is organized? What are the features/objects that constitute our perceptual experience of internal and external events? How are the senses integrated? What is the relationship between subjective experience and the physical world?" ~ wiki

The brain transfers the information or feelings from nerves to other nerves that take it to the brain. our body is one big collection of nerves - muscles are reactive to our brains, so they must have nerves, for example, yes? this means that it is not a "private percept," but rather a surge of available feelings from nerves to be translated into emotions - we do not see things, we feel things, as, our eyes are not taking the brain to the information, the eyes are generating a picture for us in our brain based on what they feel, yes?

The relationship between our minds and the world are down to 'emotions' making us 'feel' the world around us. if we measure the world, we will get other terms for it, and, some particles are bigger than other ones, so there is no constant, except those we agree on. if you were to stick your hand in a fire, and burn yourself, you would say fire is bad, but if you made a barbecue, you would say fire is good. so, our opinions change as quickly as the world around us changes.

"Learning and memory: Where do our memories get stored and how are they retrieved again? How can learning be improved? What is the difference between explicit and implicit memories? What molecule is responsible for synaptic tagging?" ~ wiki

Memory is a stored emotion. the more information crammed into that emotional instant, is reflected by a recurring memory, one that you cannot help but feel 'aroused' by. now, i am not sure if they are stored in the brain, traveling around as if they were fish in a fish tank, or if they are actually linked to the nervous system, telling nerves how to react - that is my main question i personally have. but, most people accept that the brain fish tank theory is more useful, so let's stick to it?

If the memories are jumping around, you can access them by emotionally imposing a feeling on yourself that links to this other 'set of emotions.' the pre motor cortex i find is the real power of the brain, as it processes information coming in and going out of the brain, of course. this is because it leads to activities in the motor cortex, which is like the 'engine' of the brain. before anything can be felt or sent out, it needs to go through the premotor cortex, of course.
